

### Energy Efficiency

A precondition for high energy-efficiency is the analysis of the entire pump system and pump periphery. Usually highly energy-efficient pumps, drives and control conceptions are the only focus for optimizing, but optimizing the entire pump system is ideal. In this process substantial savings of the pipelines occur. When optimizing the system the pump reliability must not be sacrificed.

In this process substantial savings already during the revision of the pipelines, sacrificed when optimizing the system, the pump reliability must not be neglected.
